

ABSTRACT OF THE DISCLOSURE

A server within an online environment is configured to store a set of bookmark media objects that provide a multimedia preview of the destinations within the environment. The bookmark media objects can be graphic thumbnails of corresponding web pages, audio
5 streams, video streams or any combination thereof or other suitable media that provides a representation of the destination. A client device is communicatively coupled to the server and is configured to store references to the network destinations and references to the corresponding bookmark media objects. A web browser executing in an operating environment provided by the client device is configured to retrieve and present the bookmark
10 media objects to a user for selection. Based on the selection, the web browser accesses the corresponding network destination. Each bookmark media object is updated as a function of a current state of the corresponding network destination, user information or general conditions of the computing environment.
